InvestFlow Business Analysis and Traceability

Requirements, design rationale, and change control

Problem statement and objective

A retail investing interface can show correct individual figures while leaving their meaning unclear. Users need to distinguish available cash from invested value, identify the timeframe behind a return, and verify the latest order details before confirmation. The redesign tests whether a standalone prototype can present that context consistently.

Persona hypothesis	Current-state challenge	Future-state goal
New investor	Sees multiple balances without freshness context.	Identifies total, cash, invested value and as-of date.
Self-directed investor	Loses position or cannot tell whether a security was saved.	Uses search and watchlist controls in a predictable order.
Active investor	Can edit an order while a prior confirmation is visible.	Sees one current review state and explicitly reconfirms after edits.

Scope and constraints

Scope includes account overview, demo returns and holdings, name or ticker search, session-only watchlists, and a simulated order review. There is no broker integration, real quote feed, account data, or advice. The prototype assumes a fixed snapshot and deterministic return samples.

Functional and nonfunctional requirements

Type	Requirement and verification
Functional	BR01 and BR03. Reconcile balances and bind the selected period to chart, values and table. B02 to B04 and B12.
Functional	BR04 to BR06. Search by name or ticker, manage session-only saves, and validate or clear the order review. B05 to B11.
Quality	BR02 and BR07. Provide named controls, visible focus, selected state, predictable traversal and narrow layouts. A01 to A09 and M01 to M02.
Governance	BR08. Record traceable acceptance evidence, scope decisions and open release gates.

TRACEABILITY

From pain point to observed result

The workbook contains all ten rows, complete acceptance criteria and browser-specific results. This summary uses the original Wrike story identifiers.

Pain point	Requirement / story	Screen and tests	Verified result
P01	BR01 / IF-010, IF-012, IF-013	Overview / B02	Pass in both browsers
P02	BR03 / IF-016, IF-017	Portfolio / B03, B04	Pass in both browsers
P03	BR01 / IF-012, IF-018	Portfolio and Overview / B12	Pass in both browsers
P04	BR04 / IF-024, IF-025	Research / B05	Pass in both browsers
P05	BR05 / IF-025, IF-026, IF-030	Research and Watchlist / B06, B07, B11	Pass in both browsers
P06	BR06 / IF-033, IF-035, IF-036	Order review / B08, B09, B10, A08	Pass in both browsers
P07	BR02 / IF-011, IF-026, IF-040, IF-041	Navigation, Portfolio, Watchlist, Research / A01, A02, A03, A04, A05, A06	Pass in both browsers
P08	BR07 / IF-011, IF-040	Mobile navigation and Order review / M01, M02	Pass in both browsers
P09	BR02 / IF-040, IF-041	All five views / A07, A09	Pass in both browsers
P10	BR08 / IF-042, IF-046, IF-047	Release evidence and governance / B02, B04, B10, A03, A04, A07	Process evidence only. Release decision open.

Story acceptance example

As an investor reviewing a demo order, I need any edit to invalidate my previous confirmation so I can verify current terms. Given that two ALFA shares have been confirmed, when quantity changes to three, the $375 estimate appears and the old confirmation clears. Changing the ticker follows the same rule. B10 exercised both changes.

Prioritization and stakeholder communication

Decision	Reason and acceptance
CR01 Confirmation freshness	High consequence at a confirmation point. Implemented in the prototype and retested in both browsers. Live Wrike status and release acceptance remain open.
CR02 Keyboard and selection	Broad reach across critical journeys. Expose active state, preserve focus after save and restore it after removal. Verified on the tested browsers.
CR03 Return context	Users need a matching explanation and trend. Use deterministic demo samples and a text or tabular alternative. No real data feed is implied.
Deferred scope	Comparison and notes, cost basis and education, and loading or cancellation stay in the register pending a scope decision.

Dependency and scope review

Use the existing 12 finish-to-start links to identify downstream impact when reviewing changes. Update acceptance criteria and verification before proposing changes to estimates or dates. The holiday capacity decision remains open. The plan preserves 47 delivery tasks and 143 estimated points.

Audience role	Proposed communication	Decision or evidence
Product Owner	Backlog refinement and change review	Priority, deferral, and scope approval
UX/UI Designer and Business Analyst	Screen and criterion walkthrough	Expected interaction and any assumptions
QA Analyst	Defect triage and pre-gate review	Reproduction steps and retest evidence
Agile Project Coordinator	Weekly status and gate readout	Dependencies, risks, decisions and dates
Compliance Analyst	Pre-release disclosure review	Demo boundaries and customer-facing claims

These are communication and decision plans for role placeholders. No stakeholder meeting, approval, or customer validation is recorded.
